

**SPECIFICATION AMENDMENTS**

Please replace paragraph [0018] with the following rewritten paragraph:

- [0018] In one method of the kingpin bolt replacement operation, the baseplate is flipped upside down and the baseplate 302 is inserted in the opposite direction, so that the baseplate 302 end that entered the channel 102 first is now the closest to the entrance of the channel 102. Since the angle of entry of the kingpin bolt is commonly from 5 and 45 degrees from vertical, this inversion of the baseplate 302 will allow the application of force ~~304~~ 310 to the replacement kingpin bolt in a secure manner. As can be seen in FIG. 4, the application of force will force the baseplate 302 into the channel 102 and will secure its movement by way of the stopping end 106. As previously described, due to the possibility of inserting kingpin bolts from either direction of the baseplate, the operation of the present invention may be inverted to allow for removal of a kingpin bolt from either direction of insertion into the baseplate.-
